Data Science for Economists

Lecture 5: Data cleaning & wrangling: (1) Tidyverse

Grant McDermott
University of Oregon | EC 607

Table of contents

Prologue

What is "tidy" data?

Resources:

- Vignette (from the **tidyr** package)
- Original paper (Hadley Wickham, 2014 JSS)

What is "tidy" data?

Resources:

- Vignette (from the **tidyr** package)
- Original paper (Hadley Wickham, 2014 JSS)

Key points:

1. Each variable forms a column.
2. Each observation forms a row.
3. Each type of observational unit forms a table.

What is "tidy" data?

Resources:

- Vignette (from the **tidyr** package)
- Original paper (Hadley Wickham, 2014 JSS)

Key points:

1. Each variable forms a column.
2. Each observation forms a row.
3. Each type of observational unit forms a table.

Basically, tidy data is more likely to be long (i.e. narrow) format than wide format.

Checklist

R packages you'll need today

☑ **tidyverse**

☑ **nycflights13**

Checklist

R packages you'll need today

☑ **tidyverse**

☑ **nycflights13**

I'll hold off loading these libraries for now. But you can install/update them both with the following command.

```
install.packages(c('tidyverse', 'nycflights13'), repos = 'https://cran.rstudio.com
```

Tip: If you're on Linux, then I *strongly* recommend installing the pre-compiled binary versions of these packages from RSPM instead of CRAN. The exact repo mirror varies by distro (see the link). But on Ubuntu 20.04, for example, you'd use:

```
install.packages(c('tidyverse', 'nycflights13'), repos = 'https://packagemanager.r
```

Tidyverse basics

Tidyverse vs. base R

Much digital ink has been spilled over the "tidyverse vs. base R" debate.

Tidyverse vs. base R

Much digital ink has been spilled over the "tidyverse vs. base R" debate.

I won't delve into this debate here, because I think the answer is clear: We should teach the tidyverse first (or, at least, early).

- The documentation and community support are outstanding.
- Having a consistent philosophy and syntax makes it easier to learn.
- Provides a convenient "front-end" to big data tools that we'll use later in the course.
- For data cleaning, wrangling, and plotting, the tidyverse really is a no-brainer.[1]

[1] I'm also a huge fan of **data.table**. This package will be the subject of our next lecture.

Tidyverse vs. base R

Much digital ink has been spilled over the "tidyverse vs. base R" debate.

I won't delve into this debate here, because I think the answer is clear: We should teach the tidyverse first (or, at least, early).

- The documentation and community support are outstanding.
- Having a consistent philosophy and syntax makes it easier to learn.
- Provides a convenient "front-end" to big data tools that we'll use later in the course.
- For data cleaning, wrangling, and plotting, the tidyverse really is a no-brainer.[1]

But... this certainly shouldn't put you off learning base R alternatives.

- Base R is extremely flexible and powerful (and stable).
- There are some things that you'll have to venture outside of the tidyverse for.
- A combination of tidyverse and base R is often the best solution to a problem.
- Excellent base R data manipulation tutorials: here and here.

[1] I'm also a huge fan of **data.table**. This package will be the subject of our next lecture.

Tidyverse vs. base R (cont.)

One point of convenience is that there is often a direct correspondence between a tidyverse command and its base R equivalent.

These generally follow a `tidyverse :: snake_case` vs `base :: period.case` rule. E.g. Compare:

tidyverse	base
`?readr :: read_csv`	`?utils :: read.csv`
`?dplyr :: if_else`	`?base :: ifelse`
`?tibble :: tibble`	`?base :: data.frame`

Etcetera.

If you call up the above examples, you'll see that the tidyverse alternative typically offers some enhancements or other useful options (and sometimes restrictions) over its base counterpart.

Tidyverse vs. base R (cont.)

One point of convenience is that there is often a direct correspondence between a tidyverse command and its base R equivalent.

These generally follow a `tidyverse :: snake_case` vs `base :: period.case` rule. E.g. Compare:

tidyverse	base
`?readr :: read_csv`	`?utils :: read.csv`
`?dplyr :: if_else`	`?base :: ifelse`
`?tibble :: tibble`	`?base :: data.frame`

Etcetera.

If you call up the above examples, you'll see that the tidyverse alternative typically offers some enhancements or other useful options (and sometimes restrictions) over its base counterpart.

Remember: There are (almost) always multiple ways to achieve a single goal in R.

Tidyverse packages

Let's load the tidyverse meta-package and check the output.

```
library(tidyverse)
```

```
## ── Attaching packages ───────────────────────────────────────── tidyverse 1.3.0 ──

## ✓ ggplot2 3.3.3      ✓ purrr   0.3.4
## ✓ tibble  3.0.6      ✓ dplyr   1.0.3
## ✓ tidyr   1.1.2      ✓ stringr 1.4.0
## ✓ readr   1.4.0      ✓ forcats 0.5.1

## ── Conflicts ──────────────────────────────────────── tidyverse_conflicts() ──
## x dplyr :: filter() masks stats :: filter()
## x dplyr :: lag()    masks stats :: lag()
```

Tidyverse packages

Let's load the tidyverse meta-package and check the output.

```
library(tidyverse)
```

```
## ── Attaching packages ──────────────────────────────────────── tidyverse 1.3.0 ──

## ✓ ggplot2 3.3.3     ✓ purrr   0.3.4
## ✓ tibble  3.0.6     ✓ dplyr   1.0.3
## ✓ tidyr   1.1.2     ✓ stringr 1.4.0
## ✓ readr   1.4.0     ✓ forcats 0.5.1

## ── Conflicts ───────────────────────────────────────── tidyverse_conflicts() ──
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
```

We see that we have actually loaded a number of packages (which could also be loaded individually): **ggplot2**, **tibble**, **dplyr**, etc.

- We can also see information about the package versions and some namespace conflicts.

Tidyverse packages (cont.)

The tidyverse actually comes with a lot more packages than those that are just loaded automatically.[1]

```
tidyverse_packages()
```

```
##  [1] "broom"      "cli"        "crayon"     "dbplyr"     "dplyr"
##  [6] "forcats"    "ggplot2"    "haven"      "hms"        "httr"
## [11] "jsonlite"   "lubridate"  "magrittr"   "modelr"     "pillar"
## [16] "purrr"      "readr"      "readxl"     "reprex"     "rlang"
## [21] "rstudioapi" "rvest"      "stringr"    "tibble"     "tidyr"
## [26] "xml2"       "tidyverse"
```

We'll use several of these additional packages during the remainder of this course.

- E.g. The **lubridate** package for working with dates and the **rvest** package for webscraping.
- However, bear in mind that these packages will have to be loaded separately.

[1] It also includes a *lot* of dependencies upon installation. This is a matter of some controversy.

Tidyverse packages (cont.)

I hope to cover most of the tidyverse packages over the length of this course.

Today, however, I'm only really going to focus on two packages:

1. **dplyr**
2. **tidyr**

These are the workhorse packages for cleaning and wrangling data. They are thus the ones that you will likely make the most use of (alongside **ggplot2**, which we already met back in Lecture 1).

- Data cleaning and wrangling occupies an inordinate amount of time, no matter where you are in your research career.

An aside on pipes: %>%

We already learned about pipes in our lecture on the bash shell. The tidyverse loads its own pipe operator, denoted `%>%`.

I want to reiterate how cool pipes are, and how using them can dramatically improve the experience of reading and writing code. Compare:

```
## These next two lines of code do exactly the same thing.
mpg %>% filter(manufacturer=="audi") %>% group_by(model) %>% summarise(hwy_mean =
summarise(group_by(filter(mpg, manufacturer=="audi"), model), hwy_mean = mean(hwy)
```

An aside on pipes: %>%

We already learned about pipes in our lecture on the bash shell. The tidyverse loads its own pipe operator, denoted `%>%`.

I want to reiterate how cool pipes are, and how using them can dramatically improve the experience of reading and writing code. Compare:

```
## These next two lines of code do exactly the same thing.
mpg %>% filter(manufacturer=="audi") %>% group_by(model) %>% summarise(hwy_mean =
summarise(group_by(filter(mpg, manufacturer=="audi"), model), hwy_mean = mean(hwy)
```

The first line reads from left to right, exactly how I thought of the operations in my head.

- Take this object (`mpg`), do this (`filter`), then do this (`group_by`), etc.

The second line totally inverts this logical order (the final operation comes first!)

- Who wants to read things inside out?

An aside on pipes: %>% (cont.)

The piped version of the code is even more readable if we write it over several lines. Here it is again and, this time, I'll run it for good measure so you can see the output:

```
mpg %>%
   filter(manufacturer=="audi") %>%
   group_by(model) %>%
   summarise(hwy_mean = mean(hwy))

## # A tibble: 3 x 2
##   model       hwy_mean
##   <chr>          <dbl>
## 1 a4              28.3
## 2 a4 quattro      25.8
## 3 a6 quattro      24
```

Remember: Using vertical space costs nothing and makes for much more readable/writeable code than cramming things horizontally.

An aside on pipes: %>% (cont.)

The piped version of the code is even more readable if we write it over several lines. Here it is again and, this time, I'll run it for good measure so you can see the output:

```
mpg %>%
   filter(manufacturer=="audi") %>%
   group_by(model) %>%
   summarise(hwy_mean = mean(hwy))
```

```
## # A tibble: 3 x 2
##    model        hwy_mean
##    <chr>           <dbl>
## 1 a4               28.3
## 2 a4 quattro       25.8
## 3 a6 quattro       24
```

Remember: Using vertical space costs nothing and makes for much more readable/writeable code than cramming things horizontally.

PS — The pipe is originally from the **magrittr** package (geddit?), which can do some other cool things if you're inclined to explore.

A further aside on the base R pipe: |>

The magrittr pipe has proven so successful and popular, that the R core team recently announced a "native" pipe would be coming to base R, denoted ▷ .[1] For example:

```r
mtcars ▷ subset(cyl==4) ▷ head()
mtcars ▷ subset(cyl==4) ▷ d ⟹ lm(mpg ~ disp, data = d)
```

[1] That's actually a | followed by a > . The default font on these slides just makes it look extra fancy.

A further aside on the base R pipe: |>

The magrittr pipe has proven so successful and popular, that the R core team recently announced a "native" pipe would be coming to base R, denoted ▷ .[1] For example:

```
mtcars ▷ subset(cyl==4) ▷ head()
mtcars ▷ subset(cyl==4) ▷ d ⟹ lm(mpg ~ disp, data = d)
```

At the time of writing this native pipe is only available in the development version of R. (I'll show an in-class demo.)

This native pipe complements some other new cool features, like support for "lambda" functions in R.

- So, worth watching this space.

[1] That's actually a | followed by a > . The default font on these slides just makes it look extra fancy.

dplyr

Aside: dplyr 1.0.0 release

Some of the **dplyr** features that we'll cover today were introduced in version 1.0.0 of the package.

- Version 1.0.0 is a big deal since it marks a stable code base for the package going forward. However, at the time of writing these slides, it had only come out very recently.
- Please make sure that you are running at least **dplyr** 1.0.0 before continuing.

```
packageVersion('dplyr')
```

```
## [1] '1.0.3'
```

```
# install.packages('dplyr') ## install updated version if < 1.0.0
```

Aside: dplyr 1.0.0 release

Some of the **dplyr** features that we'll cover today were introduced in version 1.0.0 of the package.

- Version 1.0.0 is a big deal since it marks a stable code base for the package going forward. However, at the time of writing these slides, it had only come out very recently.
- Please make sure that you are running at least **dplyr** 1.0.0 before continuing.

```
packageVersion('dplyr')
```

```
## [1] '1.0.3'
```

```
# install.packages('dplyr') ## install updated version if < 1.0.0
```

Note: **dplyr** 1.0.0 also notifies you about grouping variables every time you do operations on or with them. YMMV, but, personally, I find these messages annoying and so prefer to switch them off.

```
options(dplyr.summarise.inform = FALSE) ## Add to .Rprofile to make permanent
```

Key dplyr verbs

There are five key dplyr verbs that you need to learn.

1. `filter` : Filter (i.e. subset) rows based on their values.

2. `arrange` : Arrange (i.e. reorder) rows based on their values.

3. `select` : Select (i.e. subset) columns by their names:

4. `mutate` : Create new columns.

5. `summarise` : Collapse multiple rows into a single summary value.[1]

---

[1] `summarize` with a "z" works too. R doesn't discriminate against uncivilised nations of the world.

Key dplyr verbs

There are five key dplyr verbs that you need to learn.

1. `filter`: Filter (i.e. subset) rows based on their values.

2. `arrange`: Arrange (i.e. reorder) rows based on their values.

3. `select`: Select (i.e. subset) columns by their names:

4. `mutate`: Create new columns.

5. `summarise`: Collapse multiple rows into a single summary value.[1]

Let's practice these commands together using the `starwars` data frame that comes pre-packaged with dplyr.

---

[1] `summarize` with a "z" works too. R doesn't discriminate against uncivilised nations of the world.

1) dplyr::filter

We can chain multiple filter commands with the pipe (`%>%`), or just separate them within a single filter command using commas.

```r
starwars %>%
  filter(
    species == "Human",
    height >= 190
    )
```

```
## # A tibble: 4 x 14
##   name   height  mass hair_color skin_color eye_color birth_year sex   gender
##   <chr>   <int> <dbl> <chr>      <chr>      <chr>           <dbl> <chr> <chr>
## 1 Dart…     202   136 none       white      yellow           41.9 male  mascu…
## 2 Qui-…     193    89 brown      fair       blue             92   male  mascu…
## 3 Dooku     193    80 white      fair       brown           102   male  mascu…
## 4 Bail…     191    NA black      tan        brown            67   male  mascu…
## # … with 5 more variables: homeworld <chr>, species <chr>, films <list>,
## #   vehicles <list>, starships <list>
```

1) dplyr::filter *cont.*

Regular expressions work well too.

```
starwars %>%
  filter(grepl("Skywalker", name))
```

```
## # A tibble: 3 x 14
##   name   height  mass hair_color skin_color eye_color birth_year sex    gender
##   <chr>   <int> <dbl> <chr>      <chr>      <chr>          <dbl> <chr> <chr>
## 1 Luke…     172    77 blond      fair       blue              19 male  mascu…
## 2 Anak…     188    84 blond      fair       blue            41.9 male  mascu…
## 3 Shmi…     163    NA black      fair       brown             72 fema… femin…
## # … with 5 more variables: homeworld <chr>, species <chr>, films <list>,
## #   vehicles <list>, starships <list>
```

1) dplyr::filter *cont.*

A very common `filter` use case is identifying (or removing) missing data cases.

```
starwars %>%
  filter(is.na(height))
```

```
## # A tibble: 6 x 14
##    name   height  mass hair_color skin_color eye_color birth_year sex    gender
##    <chr>   <int> <dbl> <chr>      <chr>      <chr>           <dbl> <chr> <chr>
## 1 Arve…      NA    NA brown      fair       brown              NA male  mascu…
## 2 Finn       NA    NA black      dark       dark               NA male  mascu…
## 3 Rey        NA    NA brown      light      hazel              NA fema… femin…
## 4 Poe …      NA    NA brown      light      brown              NA male  mascu…
## 5 BB8        NA    NA none       none       black              NA none  mascu…
## 6 Capt…      NA    NA unknown    unknown    unknown            NA <NA>  <NA>
## # … with 5 more variables: homeworld <chr>, species <chr>, films <list>,
## #   vehicles <list>, starships <list>
```

1) dplyr::filter *cont.*

A very common `filter` use case is identifying (or removing) missing data cases.

```
starwars %>%
  filter(is.na(height))
```

```
## # A tibble: 6 x 14
##    name   height  mass hair_color skin_color eye_color birth_year sex    gender
##    <chr>   <int> <dbl> <chr>      <chr>      <chr>           <dbl> <chr>  <chr>
## 1 Arve…      NA    NA brown      fair       brown              NA male   mascu…
## 2 Finn       NA    NA black      dark       dark               NA male   mascu…
## 3 Rey        NA    NA brown      light      hazel              NA fema…  femin…
## 4 Poe …      NA    NA brown      light      brown              NA male   mascu…
## 5 BB8        NA    NA none       none       black              NA none   mascu…
## 6 Capt…      NA    NA unknown    unknown    unknown            NA <NA>   <NA>
## # … with 5 more variables: homeworld <chr>, species <chr>, films <list>,
## #   vehicles <list>, starships <list>
```

To remove missing observations, simply use negation: `filter(!is.na(height))`. Try this yourself.

2) dplyr::arrange

```
starwars %>%
  arrange(birth_year)
```

```
## # A tibble: 87 x 14
##    name   height  mass hair_color skin_color eye_color birth_year sex    gender
##    <chr>   <int> <dbl> <chr>      <chr>      <chr>          <dbl> <chr> <chr>
##  1 Wick…      88  20   brown      brown      brown              8  male  mascu…
##  2 IG-88     200 140   none       metal      red               15  none  mascu…
##  3 Luke…     172  77   blond      fair       blue              19  male  mascu…
##  4 Leia…     150  49   brown      light      brown             19  fema… femin…
##  5 Wedg…     170  77   brown      fair       hazel             21  male  mascu…
##  6 Plo …     188  80   none       orange     black             22  male  mascu…
##  7 Bigg…     183  84   black      light      brown             24  male  mascu…
##  8 Han …     180  80   brown      fair       brown             29  male  mascu…
##  9 Land…     177  79   black      dark       brown             31  male  mascu…
## 10 Boba…     183  78.2 black      fair       brown           31.5  male  mascu…
## # … with 77 more rows, and 5 more variables: homeworld <chr>, species <chr>,
## #   films <list>, vehicles <list>, starships <list>
```

2) dplyr::arrange

```
starwars %>%
  arrange(birth_year)
```

```
## # A tibble: 87 x 14
##     name   height  mass hair_color skin_color eye_color birth_year sex    gender
##     <chr>   <int> <dbl> <chr>      <chr>      <chr>          <dbl> <chr> <chr>
##  1 Wick…      88    20  brown      brown      brown              8  male  mascu…
##  2 IG-88     200   140  none       metal      red               15  none  mascu…
##  3 Luke…     172    77  blond      fair       blue              19  male  mascu…
##  4 Leia…     150    49  brown      light      brown             19  fema… femin…
##  5 Wedg…     170    77  brown      fair       hazel             21  male  mascu…
##  6 Plo …     188    80  none       orange     black             22  male  mascu…
##  7 Bigg…     183    84  black      light      brown             24  male  mascu…
##  8 Han …     180    80  brown      fair       brown             29  male  mascu…
##  9 Land…     177    79  black      dark       brown             31  male  mascu…
## 10 Boba…     183  78.2  black      fair       brown           31.5  male  mascu…
## # … with 77 more rows, and 5 more variables: homeworld <chr>, species <chr>,
## #   films <list>, vehicles <list>, starships <list>
```

Note: Arranging on a character-based column (i.e. strings) will sort alphabetically. Try this yourself by arranging according to the "name" column.

2) dplyr::arrange *cont.*

We can also arrange items in descending order using `arrange(desc())`.

```
starwars %>%
  arrange(desc(birth_year))
```

```
## # A tibble: 87 x 14
##     name   height   mass hair_color skin_color eye_color birth_year sex    gender
##     <chr>  <int> <dbl> <chr>      <chr>      <chr>          <dbl> <chr> <chr>
##  1 Yoda       66    17 white      green      brown            896 male  mascu…
##  2 Jabb…     175  1358 <NA>       green-tan… orange           600 herm… mascu…
##  3 Chew…     228   112 brown      unknown    blue             200 male  mascu…
##  4 C-3PO     167    75 <NA>       gold       yellow           112 none  mascu…
##  5 Dooku     193    80 white      fair       brown            102 male  mascu…
##  6 Qui-…     193    89 brown      fair       blue              92 male  mascu…
##  7 Ki-A…     198    82 white      pale       yellow            92 male  mascu…
##  8 Fini…     170    NA blond      fair       blue              91 male  mascu…
##  9 Palp…     170    75 grey       pale       yellow            82 male  mascu…
## 10 Clie…     183    NA brown      fair       blue              82 male  mascu…
## # … with 77 more rows, and 5 more variables: homeworld <chr>, species <chr>,
## #   films <list>, vehicles <list>, starships <list>
```

3) dplyr::select

Use commas to select multiple columns out of a data frame. (You can also use "first:last" for consecutive columns). Deselect a column with "-".

```
starwars %>%
  select(name:skin_color, species, -height)
```

```
## # A tibble: 87 x 5
##    name                 mass hair_color    skin_color   species
##    <chr>               <dbl> <chr>         <chr>        <chr>
##  1 Luke Skywalker         77 blond         fair         Human
##  2 C-3PO                  75 <NA>          gold         Droid
##  3 R2-D2                  32 <NA>          white, blue  Droid
##  4 Darth Vader           136 none          white        Human
##  5 Leia Organa            49 brown         light        Human
##  6 Owen Lars             120 brown, grey   light        Human
##  7 Beru Whitesun lars     75 brown         light        Human
##  8 R5-D4                  32 <NA>          white, red   Droid
##  9 Biggs Darklighter      84 black         light        Human
## 10 Obi-Wan Kenobi         77 auburn, white fair         Human
## # … with 77 more rows
```

3) dplyr::select *cont.*

You can also rename some (or all) of your selected variables in place.

```
starwars %>%
  select(alias=name, crib=homeworld, sex=gender)
```

```
## # A tibble: 87 x 3
##    alias              crib     sex
##    <chr>              <chr>    <chr>
##  1 Luke Skywalker     Tatooine masculine
##  2 C-3PO              Tatooine masculine
##  3 R2-D2              Naboo    masculine
##  4 Darth Vader        Tatooine masculine
##  5 Leia Organa        Alderaan feminine
##  6 Owen Lars          Tatooine masculine
##  7 Beru Whitesun lars Tatooine feminine
##  8 R5-D4              Tatooine masculine
##  9 Biggs Darklighter  Tatooine masculine
## 10 Obi-Wan Kenobi     Stewjon  masculine
## # … with 77 more rows
```

3) dplyr::select *cont.*

You can also rename some (or all) of your selected variables in place.

```
starwars %>%
  select(alias=name, crib=homeworld, sex=gender)
```

```
## # A tibble: 87 x 3
##    alias              crib      sex
##    <chr>              <chr>     <chr>
##  1 Luke Skywalker     Tatooine masculine
##  2 C-3PO              Tatooine masculine
##  3 R2-D2              Naboo    masculine
##  4 Darth Vader        Tatooine masculine
##  5 Leia Organa        Alderaan feminine
##  6 Owen Lars          Tatooine masculine
##  7 Beru Whitesun lars Tatooine feminine
##  8 R5-D4              Tatooine masculine
##  9 Biggs Darklighter  Tatooine masculine
## 10 Obi-Wan Kenobi     Stewjon  masculine
## # … with 77 more rows
```

If you just want to rename columns without subsetting them, you can use `rename`. Try this now by replacing `select( ... )` in the above code chunk with `rename( ... )`.

3) dplyr::select *cont.*

The `select(contains(PATTERN))` option provides a nice shortcut in relevant cases.

```
starwars %>%
  select(name, contains("color"))
```

```
## # A tibble: 87 x 4
##    name              hair_color    skin_color  eye_color
##    <chr>             <chr>         <chr>       <chr>
##  1 Luke Skywalker    blond         fair        blue
##  2 C-3PO             <NA>          gold        yellow
##  3 R2-D2             <NA>          white, blue red
##  4 Darth Vader       none          white       yellow
##  5 Leia Organa       brown         light       brown
##  6 Owen Lars         brown, grey   light       blue
##  7 Beru Whitesun lars brown        light       blue
##  8 R5-D4             <NA>          white, red  red
##  9 Biggs Darklighter black         light       brown
## 10 Obi-Wan Kenobi    auburn, white fair        blue-gray
## # … with 77 more rows
```

3) dplyr::select *cont.*

The `select( ... , everything())` option is another useful shortcut if you only want to bring some variable(s) to the "front" of a data frame.

```
starwars %>%
  select(species, homeworld, everything()) %>%
  head(5)
```

```
## # A tibble: 5 x 14
##    species homeworld name   height  mass hair_color skin_color eye_color
##    <chr>   <chr>     <chr>  <int> <dbl> <chr>      <chr>      <chr>
## 1 Human    Tatooine  Luke…    172    77 blond      fair       blue
## 2 Droid    Tatooine  C-3PO    167    75 <NA>       gold       yellow
## 3 Droid    Naboo     R2-D2     96    32 <NA>       white, bl… red
## 4 Human    Tatooine  Dart…    202   136 none       white      yellow
## 5 Human    Alderaan  Leia…    150    49 brown      light      brown
## # … with 6 more variables: birth_year <dbl>, sex <chr>, gender <chr>,
## #   films <list>, vehicles <list>, starships <list>
```

3) dplyr::select *cont.*

The `select( ... , everything())` option is another useful shortcut if you only want to bring some variable(s) to the "front" of a data frame.

```
starwars %>%
  select(species, homeworld, everything()) %>%
  head(5)
```

```
## # A tibble: 5 x 14
##   species homeworld name  height mass hair_color skin_color eye_color
##   <chr>   <chr>     <chr>  <int> <dbl> <chr>      <chr>      <chr>
## 1 Human   Tatooine  Luke…    172   77 blond      fair       blue
## 2 Droid   Tatooine  C-3PO    167   75 <NA>       gold       yellow
## 3 Droid   Naboo     R2-D2     96   32 <NA>       white, bl… red
## 4 Human   Tatooine  Dart…    202  136 none       white      yellow
## 5 Human   Alderaan  Leia…    150   49 brown      light      brown
## # … with 6 more variables: birth_year <dbl>, sex <chr>, gender <chr>,
## #   films <list>, vehicles <list>, starships <list>
```

Note: The new `relocate` function available in dplyr 1.0.0 has brought a lot more functionality to ordering of columns. See here.

4) dplyr::mutate

You can create new columns from scratch, or (more commonly) as transformations of existing columns.

```
starwars %>%
  select(name, birth_year) %>%
  mutate(dog_years = birth_year * 7) %>%
  mutate(comment = paste0(name, " is ", dog_years, " in dog years."))

## # A tibble: 87 x 4
##    name              birth_year dog_years comment
##    <chr>                  <dbl>     <dbl> <chr>
##  1 Luke Skywalker            19       133  Luke Skywalker is 133 in dog years.
##  2 C-3PO                    112       784  C-3PO is 784 in dog years.
##  3 R2-D2                     33       231  R2-D2 is 231 in dog years.
##  4 Darth Vader             41.9      293. Darth Vader is 293.3 in dog years.
##  5 Leia Organa               19       133  Leia Organa is 133 in dog years.
##  6 Owen Lars                 52       364  Owen Lars is 364 in dog years.
##  7 Beru Whitesun lars        47       329  Beru Whitesun lars is 329 in dog yea…
##  8 R5-D4                     NA        NA  R5-D4 is NA in dog years.
##  9 Biggs Darklighter         24       168  Biggs Darklighter is 168 in dog year…
## 10 Obi-Wan Kenobi            57       399  Obi-Wan Kenobi is 399 in dog years.
## # … with 77 more rows
```

4) dplyr::mutate *cont.*

Note: `mutate` is order aware. So you can chain multiple mutates in a single call.

```
starwars %>%
  select(name, birth_year) %>%
  mutate(
    dog_years = birth_year * 7, ## Separate with a comma
    comment = paste0(name, " is ", dog_years, " in dog years.")
    )
```

```
## # A tibble: 87 x 4
##    name                birth_year dog_years comment
##    <chr>                    <dbl>     <dbl> <chr>
##  1 Luke Skywalker              19       133  Luke Skywalker is 133 in dog years.
##  2 C-3PO                      112       784  C-3PO is 784 in dog years.
##  3 R2-D2                       33       231  R2-D2 is 231 in dog years.
##  4 Darth Vader               41.9      293. Darth Vader is 293.3 in dog years.
##  5 Leia Organa                19       133  Leia Organa is 133 in dog years.
##  6 Owen Lars                  52       364  Owen Lars is 364 in dog years.
##  7 Beru Whitesun lars         47       329  Beru Whitesun lars is 329 in dog yea…
##  8 R5-D4                       NA        NA  R5-D4 is NA in dog years.
##  9 Biggs Darklighter          24       168  Biggs Darklighter is 168 in dog year…
## 10 Obi-Wan Kenobi             57       399  Obi-Wan Kenobi is 399 in dog years.
## # … with 77 more rows
```

4) dplyr::mutate *cont.*

Boolean, logical and conditional operators all work well with `mutate` too.

```
starwars %>%
  select(name, height) %>%
  filter(name %in% c("Luke Skywalker", "Anakin Skywalker")) %>%
  mutate(tall1 = height > 180) %>%
  mutate(tall2 = ifelse(height > 180, "Tall", "Short")) ## Same effect, but can ch

## # A tibble: 2 x 4
##   name             height tall1 tall2
##   <chr>             <int> <lgl> <chr>
## 1 Luke Skywalker      172 FALSE Short
## 2 Anakin Skywalker    188 TRUE  Tall
```

4) dplyr::mutate *cont.*

Lastly, combining `mutate` with the new `across` feature in dplyr 1.0.0+ allows you to easily work on a subset of variables. For example:

```
starwars %>%
  select(name:eye_color) %>%
  mutate(across(where(is.character), toupper)) %>%
  head(5)

## # A tibble: 5 x 6
##   name            height  mass hair_color skin_color  eye_color
##   <chr>            <int> <dbl> <chr>      <chr>       <chr>
## 1 LUKE SKYWALKER     172    77 BLOND      FAIR        BLUE
## 2 C-3PO              167    75 <NA>       GOLD        YELLOW
## 3 R2-D2               96    32 <NA>       WHITE, BLUE RED
## 4 DARTH VADER        202   136 NONE       WHITE       YELLOW
## 5 LEIA ORGANA        150    49 BROWN      LIGHT       BROWN
```

4) dplyr::mutate *cont.*

Lastly, combining `mutate` with the new `across` feature in dplyr 1.0.0+ allows you to easily work on a subset of variables. For example:

```
starwars %>%
  select(name:eye_color) %>%
  mutate(across(where(is.character), toupper)) %>%
  head(5)

## # A tibble: 5 x 6
##   name              height  mass hair_color skin_color   eye_color
##   <chr>              <int> <dbl> <chr>      <chr>        <chr>
## 1 LUKE SKYWALKER       172    77 BLOND      FAIR         BLUE
## 2 C-3PO                167    75 <NA>       GOLD         YELLOW
## 3 R2-D2                 96    32 <NA>       WHITE, BLUE  RED
## 4 DARTH VADER          202   136 NONE       WHITE        YELLOW
## 5 LEIA ORGANA          150    49 BROWN      LIGHT        BROWN
```

Note: This workflow (i.e. combining `mutate` and `across`) supersedes the old "scoped" variants of `mutate` that you might have used previously. More details here and here.

5) dplyr::summarise

Particularly useful in combination with the `group_by` command.

```
starwars %>%
  group_by(species, gender) %>%
  summarise(mean_height = mean(height, na.rm = TRUE))
```

```
## # A tibble: 42 x 3
## # Groups:   species [38]
##    species    gender      mean_height
##    <chr>      <chr>             <dbl>
##  1 Aleena     masculine            79
##  2 Besalisk   masculine           198
##  3 Cerean     masculine           198
##  4 Chagrian   masculine           196
##  5 Clawdite   feminine            168
##  6 Droid      feminine             96
##  7 Droid      masculine           140
##  8 Dug        masculine           112
##  9 Ewok       masculine            88
## 10 Geonosian  masculine           183
## # … with 32 more rows
```

5) dplyr::summarise *cont.*

Note that including "na.rm = TRUE" (or, its alias "na.rm = T") is usually a good idea with summarise functions. Otherwise, any missing value will propogate to the summarised value too.

```
## Probably not what we want
starwars %>%
  summarise(mean_height = mean(height))

## # A tibble: 1 x 1
##   mean_height
##         <dbl>
## 1          NA

## Much better
starwars %>%
  summarise(mean_height = mean(height, na.rm = TRUE))

## # A tibble: 1 x 1
##   mean_height
##         <dbl>
## 1        174.
```

5) dplyr::summarise *cont.*

The same `across`-based workflow that we saw with `mutate` a few slides back also works
with `summarise`. For example:

```
starwars %>%
  group_by(species) %>%
  summarise(across(where(is.numeric), mean, na.rm=T)) %>%
  head(5)
```

```
## # A tibble: 5 x 4
##   species   height  mass birth_year
##   <chr>      <dbl> <dbl>      <dbl>
## 1 Aleena        79    15        NaN
## 2 Besalisk     198   102        NaN
## 3 Cerean       198    82         92
## 4 Chagrian     196   NaN        NaN
## 5 Clawdite     168    55        NaN
```

5) dplyr::summarise *cont.*

The same `across` -based workflow that we saw with `mutate` a few slides back also works with `summarise` . For example:

```
starwars %>%
  group_by(species) %>%
  summarise(across(where(is.numeric), mean, na.rm=T)) %>%
  head(5)

## # A tibble: 5 x 4
##   species   height  mass birth_year
##   <chr>      <dbl> <dbl>      <dbl>
## 1 Aleena        79    15        NaN
## 2 Besalisk     198   102        NaN
## 3 Cerean       198    82         92
## 4 Chagrian     196   NaN        NaN
## 5 Clawdite     168    55        NaN
```

Note: Again, this functionality supersedes the old "scoped" variants of `summarise` that you used prior to dplyr 1.0.0. Details here and here.

Other dplyr goodies

`group_by` and `ungroup`: For (un)grouping.

- Particularly useful with the `summarise` and `mutate` commands, as we've already seen.

Other dplyr goodies

`group_by` and `ungroup` : For (un)grouping.

- Particularly useful with the `summarise` and `mutate` commands, as we've already seen.

`slice` : Subset rows by position rather than filtering by values.

- E.g. `starwars %>% slice(c(1, 5))`

Other dplyr goodies

`group_by` and `ungroup` : For (un)grouping.

- Particularly useful with the `summarise` and `mutate` commands, as we've already seen.

`slice` : Subset rows by position rather than filtering by values.

- E.g. `starwars %>% slice(c(1, 5))`

`pull` : Extract a column from as a data frame as a vector or scalar.

- E.g. `starwars %>% filter(gender=="female") %>% pull(height)`

Other dplyr goodies

`group_by` and `ungroup`: For (un)grouping.

- Particularly useful with the `summarise` and `mutate` commands, as we've already seen.

`slice`: Subset rows by position rather than filtering by values.

- E.g. `starwars %>% slice(c(1, 5))`

`pull`: Extract a column from as a data frame as a vector or scalar.

- E.g. `starwars %>% filter(gender=="female") %>% pull(height)`

`count` and `distinct`: Number and isolate unique observations.

- E.g. `starwars %>% count(species)`, or `starwars %>% distinct(species)`
- You could also use a combination of `mutate`, `group_by`, and `n()`, e.g. `starwars %>% group_by(species) %>% mutate(num = n())`.

Other dplyr goodies (cont.)

There are also a whole class of window functions for getting leads and lags, ranking, creating cumulative aggregates, etc.

- See `vignette("window-functions")`.

Other dplyr goodies (cont.)

There are also a whole class of window functions for getting leads and lags, ranking, creating cumulative aggregates, etc.

- See `vignette("window-functions")`.

The final set of dplyr "goodies" are the family of join operations. However, these are important enough that I want to go over some concepts in a bit more depth...

- We will encounter and practice these many more times as the course progresses.

Joining operations

One of the mainstays of the dplyr package is merging data with the family join operations.

- `inner_join(df1, df2)`
- `left_join(df1, df2)`
- `right_join(df1, df2)`
- `full_join(df1, df2)`
- `semi_join(df1, df2)`
- `anti_join(df1, df2)`

(You find find it helpful to to see visual depictions of the different join operations here.)

Joining operations

One of the mainstays of the dplyr package is merging data with the family join operations.

- `inner_join(df1, df2)`
- `left_join(df1, df2)`
- `right_join(df1, df2)`
- `full_join(df1, df2)`
- `semi_join(df1, df2)`
- `anti_join(df1, df2)`

(You find find it helpful to to see visual depictions of the different join operations here.)

For the simple examples that I'm going to show here, we'll need some data sets that come bundled with the **nycflights13** package.

- Load it now and then inspect these data frames in your own console.

```
library(nycflights13)
flights
planes
```

Joining operations (cont.)

Let's perform a left join on the flights and planes datasets.

- *Note*: I'm going subset columns after the join, but only to keep text on the slide.

Joining operations (cont.)

Let's perform a left join on the flights and planes datasets.

- *Note*: I'm going subset columns after the join, but only to keep text on the slide.

```
left_join(flights, planes) %>%
  select(year, month, day, dep_time, arr_time, carrier, flight, tailnum, type, mod
```

```
## Joining, by = c("year", "tailnum")

## # A tibble: 336,776 x 10
##      year month   day dep_time arr_time carrier flight tailnum type  model

Joining operations (cont.)

(*continued from previous slide*)

Note that dplyr made a reasonable guess about which columns to join on (i.e. columns that share the same name). It also told us its choices:

```
## Joining, by = c("year", "tailnum")
```

However, there's an obvious problem here: the variable "year" does not have a consistent meaning across our joining datasets!

- In one it refers to the *year of flight*, in the other it refers to *year of construction*.

Joining operations (cont.)

(*continued from previous slide*)

Note that dplyr made a reasonable guess about which columns to join on (i.e. columns that share the same name). It also told us its choices:

```
## Joining, by = c("year", "tailnum")
```

However, there's an obvious problem here: the variable "year" does not have a consistent meaning across our joining datasets!

- In one it refers to the *year of flight*, in the other it refers to *year of construction*.

Luckily, there's an easy way to avoid this problem.

- See if you can figure it out before turning to the next slide.
- Try `?dplyr::join`.

Joining operations (cont.)

(*continued from previous slide*)

You just need to be more explicit in your join call by using the `by =` argument.

- You can also rename any ambiguous columns to avoid confusion.

```
left_join(
  flights,
  planes %>% rename(year_built = year), ## Not necessary w/ below line, but helpfu
  by = "tailnum" ## Be specific about the joining column
) %>%
  select(year, month, day, dep_time, arr_time, carrier, flight, tailnum, year_buil
  head(3) ## Just to save vertical space on the slide
```

```
## # A tibble: 3 x 11

## # … with 1 more variable: model <chr>
```

Joining operations (cont.)

(*continued from previous slide*)

Last thing I'll mention for now; note what happens if we again specify the join column... but don't rename the ambiguous "year" column in at least one of the given data frames.

```
left_join(
  flights,
  planes, ## Not renaming "year" to "year_built" this time
  by = "tailnum"
) %>%
  select(contains("year"), month, day, dep_time, arr_time, carrier, flight, tailnu
  head(3)
```

```

Make sure you know what "year.x" and "year.y" are. Again, it pays to be specific.

tidyr

Key tidyr verbs

1. `pivot_longer` : Pivot wide data into long format (i.e. "melt").[1]

2. `pivot_wider` : Pivot long data into wide format (i.e. "cast").[2]

3. `separate` : Separate (i.e. split) one column into multiple columns.

4. `unite` : Unite (i.e. combine) multiple columns into one.

---

[1] Updated version of `tidyr :: gather` .

[2] Updated version of `tidyr :: spread` .

Key tidyr verbs

1. `pivot_longer`: Pivot wide data into long format (i.e. "melt").[1]

2. `pivot_wider`: Pivot long data into wide format (i.e. "cast").[2]

3. `separate`: Separate (i.e. split) one column into multiple columns.

4. `unite`: Unite (i.e. combine) multiple columns into one.

Let's practice these verbs together in class.

- Side question: Which of `pivot_longer` vs `pivot_wider` produces "tidy" data?

[1] Updated version of `tidyr :: gather`.

[2] Updated version of `tidyr :: spread`.

1) tidyr::pivot_longer

```r
stocks = data.frame( ## Could use "tibble" instead of "data.frame" if you prefer
  time = as.Date('2009-01-01') + 0:1,
  X = rnorm(2, 0, 1),
  Y = rnorm(2, 0, 2),
  Z = rnorm(2, 0, 4)
  )
stocks
```

```
##         time          X          Y         Z
## 1 2009-01-01  0.7630456 -0.7002949 -3.417682
## 2 2009-01-02 -0.4579186 -0.7498116 -6.052036
```

```r
stocks %>% pivot_longer(-time, names_to="stock", values_to="price")
```

```
## # A tibble: 6 x 3
##   time       stock price
##   <date>     <chr> <dbl>
## 1 2009-01-01 X      0.763
## 2 2009-01-01 Y     -0.700
## 3 2009-01-01 Z     -3.42
## 4 2009-01-02 X     -0.458
## 5 2009-01-02 Y     -0.750
## 6 2009-01-02 Z     -6.05
```

1) tidyr::pivot_longer *cont.*

Let's quickly save the "tidy" (i.e. long) stocks data frame for use on the next slide.

```
## Write out the argument names this time: i.e. "names_to=" and "values_to="
tidy_stocks =
  stocks %>%
  pivot_longer(-time, names_to="stock", values_to="price")
```

2) tidyr::pivot_wider

```
tidy_stocks %>% pivot_wider(names_from=stock, values_from=price)

## # A tibble: 2 x 4
##    time             X       Y      Z
##    <date>       <dbl>   <dbl>  <dbl>
## 1 2009-01-01   0.763  -0.700  -3.42
## 2 2009-01-02  -0.458  -0.750  -6.05

tidy_stocks %>% pivot_wider(names_from=time, values_from=price)

## # A tibble: 3 x 3
##    stock 2009-01-01  2009-01-02
##    <chr>       <dbl>       <dbl>
## 1 X           0.763      -0.458
## 2 Y          -0.700      -0.750
## 3 Z          -3.42       -6.05
```

2) tidyr::pivot_wider

```
tidy_stocks %>% pivot_wider(names_from=stock, values_from=price)

## # A tibble: 2 x 4
##   time          X      Y     Z
##   <date>     <dbl>  <dbl> <dbl>
## 1 2009-01-01  0.763 -0.700 -3.42
## 2 2009-01-02 -0.458 -0.750 -6.05

tidy_stocks %>% pivot_wider(names_from=time, values_from=price)

## # A tibble: 3 x 3
##   stock 2009-01-01  2009-01-02
##   <chr>       <dbl>       <dbl>
## 1 X           0.763      -0.458
## 2 Y          -0.700      -0.750
## 3 Z          -3.42       -6.05
```

Note that the second example — which has combined different pivoting arguments — has
effectively transposed the data.

Aside: Remembering the pivot_* syntax

There's a long-running joke about no-one being able to remember Stata's "reshape"
command. (Exhibit A.)

It's easy to see this happening with the `pivot_*` functions too. However, I find that I never
forget the commands as long as I remember the argument order is *"names"* then *"values"*.

3) tidyr::separate

```
economists = data.frame(name = c("Adam.Smith", "Paul.Samuelson", "Milton.Friedman"
economists
```

```
##               name
## 1      Adam.Smith
## 2  Paul.Samuelson
## 3 Milton.Friedman
```

```
economists %>% separate(name, c("first_name", "last_name"))
```

```
##   first_name last_name
## 1       Adam     Smith
## 2       Paul Samuelson
## 3     Milton  Friedman
```

3) tidyr::separate

```r
economists = data.frame(name = c("Adam.Smith", "Paul.Samuelson", "Milton.Friedman"
economists
```

```
##                name
## 1       Adam.Smith
## 2   Paul.Samuelson
## 3 Milton.Friedman
```

```r
economists %>% separate(name, c("first_name", "last_name"))
```

```
##    first_name last_name
## 1       Adam     Smith
## 2       Paul Samuelson
## 3     Milton  Friedman
```

This command is pretty smart. But to avoid ambiguity, you can also specify the separation character with `separate( ... , sep=".")`.

3) tidyr::separate *cont.*

A related function is `separate_rows`, for splitting up cells that contain multiple fields or observations (a frustratingly common occurence with survey data).

```r
jobs = data.frame(
  name = c("Jack", "Jill"),
  occupation = c("Homemaker", "Philosopher, Philanthropist, Troublemaker")
  )
jobs
```

```
##   name                                      occupation
## 1 Jack                                       Homemaker
## 2 Jill Philosopher, Philanthropist, Troublemaker
```

```r
## Now split out Jill's various occupations into different rows
jobs %>% separate_rows(occupation)
```

```
## # A tibble: 4 x 2
##   name  occupation
##   <chr> <chr>
## 1 Jack  Homemaker
## 2 Jill  Philosopher
## 3 Jill  Philanthropist
```

4) tidyr::unite

```r
gdp = data.frame(
  yr = rep(2016, times = 4),
  mnth = rep(1, times = 4),
  dy = 1:4,
  gdp = rnorm(4, mean = 100, sd = 2)
  )
gdp
```

```
##     yr mnth dy     gdp
## 1 2016    1  1 101.6175
## 2 2016    1  2 100.4228
## 3 2016    1  3 102.3959
## 4 2016    1  4 101.8645
```

```r
## Combine "yr", "mnth", and "dy" into one "date" column
gdp %>% unite(date, c("yr", "mnth", "dy"), sep = "-")
```

```
##       date     gdp
## 1 2016-1-1 101.6175
## 2 2016-1-2 100.4228
## 3 2016-1-3 102.3959
## 4 2016-1-4 101.8645
```

4) tidyr::unite *cont.*

Note that `unite` will automatically create a character variable. You can see this better if we convert it to a tibble.

```
gdp_u = gdp %>% unite(date, c("yr", "mnth", "dy"), sep = "-") %>% as_tibble()
gdp_u
```

```
## # A tibble: 4 x 2
##   date       gdp
##   <chr>    <dbl>
## 1 2016-1-1  102.
## 2 2016-1-2  100.
## 3 2016-1-3  102.
## 4 2016-1-4  102.
```

4) tidyr::unite *cont.*

Note that `unite` will automatically create a character variable. You can see this better if we convert it to a tibble.

```
gdp_u = gdp %>% unite(date, c("yr", "mnth", "dy"), sep = "-") %>% as_tibble()
gdp_u
```

```
## # A tibble: 4 x 2
##   date        gdp
##   <chr>     <dbl>
## 1 2016-1-1  102.
## 2 2016-1-2  100.
## 3 2016-1-3  102.
## 4 2016-1-4  102.
```

If you want to convert it to something else (e.g. date or numeric) then you will need to modify it using `mutate`. See the next slide for an example, using the lubridate package's super helpful date conversion functions.

4) tidyr::unite *cont.*

(continued from previous slide)

```r
library(lubridate)
gdp_u %>% mutate(date = ymd(date))
```

```
## # A tibble: 4 x 2
##   date          gdp
##   <date>      <dbl>
## 1 2016-01-01  98.5
## 2 2016-01-02 102.
## 3 2016-01-03 101.
## 4 2016-01-04 101.
```

Other tidyr goodies

Use `crossing` to get the full combination of a group of variables.[1]

```
crossing(side=c("left", "right"), height=c("top", "bottom"))
```

```
## # A tibble: 4 x 2
##    side  height
##    <chr> <chr>
## 1 left  bottom
## 2 left  top
## 3 right bottom
## 4 right top
```

[1] Base R alternative: `expand.grid`.

Other tidyr goodies

Use `crossing` to get the full combination of a group of variables.[1]

```
crossing(side=c("left", "right"), height=c("top", "bottom"))

## # A tibble: 4 x 2
##   side  height
##   <chr> <chr>
## 1 left  bottom
## 2 left  top
## 3 right bottom
## 4 right top
```

See `?expand` and `?complete` for more specialised functions that allow you to fill in (implicit) missing data or variable combinations in existing data frames.

- You'll encounter this during your next assignment.

[1] Base R alternative: `expand.grid`.

Summary

Key verbs

dplyr

1. `filter`
2. `arrange`
3. `select`
4. `mutate`
5. `summarise`

tidyr

1. `pivot_longer`
2. `pivot_wider`
3. `separate`
4. `unite`

Key verbs

dplyr

1. `filter`
2. `arrange`
3. `select`
4. `mutate`
5. `summarise`

tidyr

1. `pivot_longer`
2. `pivot_wider`
3. `separate`
4. `unite`

Other useful items include: pipes (`%>%`), grouping (`group_by`), joining functions (`left_join`, `inner_join`, etc.).

Next lecture: Data cleaning and wrangling: (2) data.table
